Source: Urban-Brookings Tax Policy Center calculations

* Technically, one should divide AGI by 1.0765 to credit the employee's income for the employer share of the Social Security tax paid on the employee's behalf.

Such a change would lower slightly average and marginal tax rates
** Poverty level
(1) Calendar year. Baseline is current law which includes the Jobs and Growth Tax Relief Reconciliation Act of 2003
(2) All income assumed from earnings
(3) Children are assumed to qualify for EITC and child credit
