* Non-zero value rounded to zero; ** Insufficient data

(1) Calendar year. Baseline is the law currently in place for 2020 as of 2019 with TCJA permanently extended.

The present value method estimates the tax expenditure as the difference between the present value of future retirement benefits from current year contributions to retiree saving plans and the present value of those retirement benefits if the same amounts were saved outside of qualified retirement plans and were not eligible for the savers' credit. The benefit of future taxes as a share of income are adjusted to account for a measure of additional future income from current year savings.

<http://www.taxpolicycenter.org/taxtopics/Baseline-Definitions.cfm>

(2) Includes both filing and non-filing units but excludes those that are dependents of other tax units. Tax units with negative adjusted gross income are excluded from their respective income class but are included in the totals. For a description of expanded cash income, see

<http://www.taxpolicycenter.org/TaxModel/income.cfm>

(3) The income percentile classes used in this table are based on the income distribution for the entire population and contain an equal number of people, not tax units. The breaks are (in 2019 dollars): 20% \$25,700; 40% \$51,300; 60% \$92,300; 80% \$167,000; 90% \$245,000; 95% \$348,000; 99% \$828,000; 99.9% \$3,708,100.

(4) Includes tax units with a change in federal tax burden of \$10 or more in absolute value

(5) After-tax income is expanded cash income less: individual income tax net of refundable credits; corporate income tax; payroll taxes (Social Security and Medicare); estate tax; and excise taxes.

(6) Average federal tax (includes individual and corporate income tax, payroll taxes for Social Security and Medicare, the estate tax, and excise taxes) as a percentage of average expanded cash income.

* Non-zero value rounded to zero; ** Insufficient data

(1) Calendar year. Baseline is the law currently in place for 2020 as of 2019 with TCJA permanently extended.

The present value method estimates the tax expenditure as the difference between the present value of future retirement benefits from current year contributions to retirement saving plans and the present value of those retirement benefits if the same amounts were saved outside of qualified retirement plans and were not eligible for the savers' credit. The benefit of future taxes as a share of income are adjusted to account for a measure of additional future income from current year saving.

<http://www.taxpolicycenter.org/taxtopics/Baseline-Definitions.cfm>

(2) Includes both filing and non-filing units but excludes those that are dependents of other tax units. Tax units with negative adjusted gross income are excluded from their respective income class but are included in the totals. For a description of expanded cash income, see

<http://www.taxpolicycenter.org/TaxModel/income.cfm>

(3) The income percentile classes used in this table are based on the income distribution for the entire population and contain an equal number of people, not tax units. The incomes used are adjusted for family size by dividing by the square root of the number of people in the tax unit. The resulting percentile breaks are (in 2019 dollars): 20% \$17,900; 40% \$35,000; 60% \$60,400; 80% \$102,100; 90% \$148,300; 95% \$208,500; 99% \$478,500; 99.9% \$2,151,900.

(4) Includes tax units with a change in federal tax burden of \$10 or more in absolute value.

(5) After-tax income is expanded cash income less: individual income tax net of refundable credits; corporate income tax; payroll taxes (Social Security and Medicare); estate tax; and excise taxes.

(6) Average federal tax (includes individual and corporate income tax, payroll taxes for Social Security and Medicare, the estate tax, and excise taxes) as a percentage of average expanded cash income.
